

August 13, 2020

To Whom It May Concern,

Victoria Cheung has completed all 18 hours of the **L.E.A.D. Supply Chain Curriculum** at the invitation of the **Genentech Discovery Program** offered July 28th - August 13th, 2020. The program is part of Pharma Technical Supply Chain's initiative to advance its inclusive and innovative culture by providing professional growth and development opportunities for college students. We were absolutely delighted to have Victoria as a participant and active contributor for all sessions of the rich program described below to enable you to better understand what Victoria took the opportunity to learn along with the other members of her **L.E.A.D. Supply Chain** cohort.

The program's curriculum consisted of the following course components:

- Supply Chain Fundamentals
- Supply Chain Design & Product Strategy
- Supply Chain Operations
- Supply Chain Transformation

Through this course, Victoria gained a basic understanding of the supply chain system landscape, the demand to supply process, the functional roles in managing a supply chain, and how digital technologies are changing supply chains.

To apply her learnings, Victoria participated in a supply chain simulation game where she was given the task of saving a supply chain from financial ruin. Working as a member of a simulated management team, students were challenged to:

- Develop a new supply chain strategy
- Create functional alignment supporting the new strategy
- Manage the functional areas of Sales, Supply Chain Management (SCM), Operations, and Purchasing
- Operate that strategy profitably

The simulation required each team member, representing a specific function within their simulated companies, to create internal alignment and to deal with trade-offs within and among functional areas.

We were highly impressed with all of this year's students, and we were given every reason to believe they will each build bright futures. We wish Victoria great success in completing her studies and during the career that follows.
